

Space

Keep this page with the host. Accept the variants listed below.

01 Mercury

NASA: About the Planets. Mercury is nearest to the Sun and is the smallest planet in our solar system.

02 Jupiter

NASA: About the Planets. Jupiter is the largest planet in our solar system and the fifth from the Sun.

03 Mars

NASA: Mars Facts. Rusting iron minerals help give Mars the reddish color behind its nickname.

04 The Sun

Also accept: Sun

NASA: Sun Facts. The Sun is our solar system's only star, and Earth is one of the planets orbiting it.

05 Eight

Also accept: 8

NASA: About the Planets. The count includes Mercury through Neptune; dwarf planets are a separate group.

06 Earth

NASA: About the Planets. The first three planets from the Sun are Mercury, Venus and then Earth.

07 Saturn

NASA: Saturn Facts. Saturn is sixth from the Sun; its rings contain countless pieces of ice and rock.

08 The Moon

Also accept: Moon

NASA: Moon Facts. The Moon is Earth's natural satellite, meaning it travels in an orbit around Earth.

09 The Milky Way

Also accept: Milky Way galaxy

NASA: Solar System Facts. Our solar system is part of the Milky Way and orbits around the galaxy's center.

10 A dwarf planet

Also accept: Dwarf planet

NASA: About the Planets. Pluto is a dwarf planet.
